DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 5, 8, 10, 14, 17, and 19-25 are rejected under 35 U.S.C. 102(b) as being anticipated by Dabbish (4972478).

In the abstract, Dabbish discloses a "...logic cryptographic circuit that can be reprogrammed with various cipher algorithms." Reprogramming implies changing means. Changeable deciphering apparatus is mentioned in column 3, lines 44-46. Part 104 on Dabbish's diagram is communication circuitry, meaning that the apparatus can be connected to a communication network. In lines 51-67 of column one, Dabbish states that orders to change the encryption algorithm originate from sources external to the apparatus.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are

Application/Control Number: 08/814409

Art Unit: 2767

such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

4. Claims 2-4, 6, 11-13, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish in view of Jovanovich et al. (5703950).

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the algorithm itself come from sources external to the circuit. Dabbish does not disclose configuration means, a compiler, libraries, databases, or mapping data objects. He further does not disclose that the cipher algorithm is encrypted. Official notice is taken that it is old and wellknown to encrypt data so as to prevent it from being used by parties other than the intended recipient. Official notice is also taken that object oriented programming is old and well-known. In lines 58-64 of column 3, Jovanovich et al. talk about storing data in a database. The data is compiled by configuration means. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to store cipher algorithms in a database from which configuration means would compile an algorithm and write it, as an object, to the circuit. In object-oriented programming, libraries containing data are common. It would also be obvious to encrypt data that is sent to the circuit. This would protect the data, foiling those who would otherwise have intercepted the data and created their own identical circuit. It would also act to disallow sending false data to the circuit. Data that was not encrypted according to a key in the circuit would not create an intelligible algorithm. Finally, it would protect the new circuit

Application/Control Number: 08/814409

Page 4

Art Unit: 2767

specifications while minimizing use of keys used to decrypt messages. This advantage is similar to the advantages of session key use as opposed to master key use.

5. Claims 7 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish.

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the algorithm itself come from sources external to the circuit. Dabbish does not say that the algorithms are updated on a periodic basis. Official notice is taken that updating keys or other cryptographic devices is old and well-known. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to allow for periodic updates of the circuit, making it particularly useful in time specific applications such as pay television systems.

6. Claims 9 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish in view of Lynn et al. (5345508).

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the algorithm itself come from sources external to the circuit. Dabbish does not mention changing the circuits specifications based upon the communication path, degree of communication path security, or the process speed required. Lynn et al. talk about changing encryption keys based upon processing time and security. They specifically describe how their invention can be used to balance these factors in the first paragraph of the brief summary, line 54 of column 2 through line 36 of column 3. Therefore it would have been obvious to a person of ordinary skill in the art at

Application/Control Number: 08/814409

Art Unit: 2767

Page 5

the time the invention was made to allow for changes in the circuits specifications based upon the communication path, degree of communication path security, or process speed required. This would give flexibility to the system, letting it adapt to security and speed requirements.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Austin (5388157) talks about a decryption circuit in a PLD, specifically in column one, lines 32-54. Sung et al. (5768372) presents a PLD with a variable decryption circuit in the abstract. Also, Ehrsam et al. (436234), Jones et al. (5623637), and Esserman et al. (5111504) are considered to be relevant to the applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Douglas Meislahn whose telephone number is (703) 305-1338. The examiner can normally be reached Monday-Thursday and every other Friday from 8:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tod Swann, can be reached at (703) 308-7791.

The fax number for Formal or Official faxes to Technology Center 2700 is (703) 308-9051 or 9052. Draft or Informal faxes for this Art Unit can be submitted to (703) 305-0040.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (703) 305-3900. SUPERVISORY OF TOO GROUP 2700
